

Quality and reliability of the after-sales service

The peculiarity of the MISA product is given by the great reliability with customized solutions, but it also stands out for its promptness, competence and quality of the after-sales service.

The objective pursued is to establish active participation relationships with its customers, based on trust and mutual exchange of information to obtain a growing improvement in the service and greater reliability of the product as a whole.

Our certifications

The Assistance Service

Thanks to careful design, carried out with a careful choice of technology, highly reliable over time, MISA offers to the institutions and customers, solutions with the main objective of reducing operating and maintenance costs which always result as a heavy expenditure chapter in the system's economy.

Adequate periodic maintenance is imposed for general plant engineering areas by the art. 8 of Ministerial Decree 37/08 and mandatory in the workplace by the Legislative Decree 81/08.

MISA offers, not only a post-sales assistance service characterized by a continuous technical relationship with the user, but also a consultancy service which provides for a continuous update regarding the standardization and is enriched and evolves towards higher levels of safety. Advice not only normative-theoretical but supported by a long experience in the field and by a practical comparison with many realities in Italy and with many entities related to the world of pumping.

In fact, more and more customers are relying on MISA for ordinary, extraordinary maintenance contracts or for "framework agreements", in compliance with current legislation. It has been shown that careful inspections and periodic and preventive checks prevent failures and limit the possibility of plant shutdown.

Our technical and operational service is able to provide legislative and regulatory updates to existing plants such as:

- plant updates with production of CEI 0-16 adequacy declarations (so that the customer no longer has to pay the Enel penalty costs or the so-called Cts);
- interventions with Declarations of Conformity (DIRI) where the customer's previous Conformity as required by Ministerial Decree 37/08 is missing or incomplete in accordance with the law;
- tests and checks with respect to the earthing systems (Presidential Decree 462/01) on new constructions or above all on existing or obsolete systems;
- adjustments, calculations and checks for power factor correction systems not adequate to the national resolution of the Authority AEEG 180/2013 / R / EEL;
- consultancy in reference to the mandatory legislation in general and to the Low Voltage and Machinery directives.

In unpredictable service interruptions due to unforeseeable failures or situations, MISA is also able to quickly offer spare parts and to promptly send super-specialized technicians able to restore the operation of the systems in a minimum time necessary. All thanks to staff with P.E.S. qualification. and P.E.I., according to the provisions of the CEI 11-27 standard, but before that, with more than twenty years of experience in this specific plant sector
